Microcell Barrique brings ergonomic concepts to the world of barrel and barrique bungs for the first time in history. Its triangular handle shape and round, smooth edges are a significant innovation enabling easier insertion and extraction from the barrel’s hole.

The transparent silicone “bubble” allows bungs customisation, while the two different handle colours simplify wine identification while in the barrel.

But innovation goes beyond ergonomic design: Microcell Barrique has been conceived to improve wine preservation while into the barrel. Oxygen and thermal favourable conditions are the main cause of aerobic bacterial growth within the barrel. Thanks to its constituents, Microcell Barrique minimize oxygen transfer through the bung’s core preserving wine quality and organoleptic integrity.

Microcell Barrique: because the quality of your wine is important.
